

## **Teaching and Research on Organic Sustainable Agriculture at UAAAN, Mexico.**

Dr. Marco A. Bustamante. Departamento de Horticultura, Universidad  
Autonoma Agraria Antonio Narro, Saltillo, Coahuila, CP 25315, Mexico

We are using a normal traditional course on plant mineral nutrition to teach students how to grow all kind of crops organically and all year around in a small garden based on the biointensive method which we find to be the most appropriate system to cover all aspects regarding sustainable production and the protection of the environment.

We also guide the students to establish different research trails, specially to compare the growth and yield of different varieties of some species, of to test the effect of different types and rates of compost, to promote the interest and make them used to doing research in any agriculture production system during their future work.

We find the students to be very much interested on what they are learning, so that we think that all academic programs and research projects at UAAAN and other universities around the world should include this approach to contribute to have more healthy food and a better environment.
